

Aurikrex CBT — Page-by-Page Redesign Handoff

Full site audit against the confirmed Aurikrex Universal Design System

- Date:

July 13, 2026
- Prepared by:

Founder & CEO Office, Aurikrex Learning Systems
- Source documents:

design_system_reference_cbt.md, Info.md, Info-verification.md
- Scope:

Aurikrex CBT only, all 6 implemented pages
- Instruction:

This document specifies WHAT changes and WHY. Exact file:line references live in the source documents above.

Priority Summary

CBT's situation is structurally different from Library's. Library had 4 rogue pages out of 28; CBT has 6 of 6 pages built entirely inline with zero shared components, running on a self-consistent but non-Aurikrex color system (indigo/violet/slate/rose/emerald) that mostly bypasses even its own defined theme tokens. This is not a rebrand — it's a first real component extraction plus a token migration, done together. One additional finding: the question-rendering logic is independently duplicated between Exam Console and Result Review rather than shared, a correctness risk on top of the design debt.

Phase	Scope	Why
1	Retire CBT's own redundant tailwind.config color aliases; adopt Universal Design System values directly	Design System values already exist. Collapse to one before building
2	Extract the 7 confirmed shared patterns into real components (list below)	Zero shared components currently exist
3	Consolidate the duplicated question-rendering logic into one shared component	Correctness risk, not just a style one
4	Apply the token migration across all 6 pages, including the now-unified Question Bank Page	Confirmed Rebrand, no admin exception
5	Remove the dead --dark-blue token; add missing disabled/empty states flagged on page one	Flagged on page one

Global Fixes — Apply Once, Affects Every Page

1. Token System — Adopt Universal Directly, Retire the Middle Layer

CBT currently defines its own color aliases in `tailwind.config.ts` (primary `#2563EB`, success `#16A34A`, danger `#DC2626`, warning `#FACC15`, background `#F9FAFB`, surface `FFFFFF`, text-primary `#111827`, text-secondary `#6B7280`, border `#E5E7EB`) — but in practice almost nothing in the actual pages uses these aliases. Every page instead reaches for raw Tailwind defaults (indigo-600, rose-500, emerald-500, slate-950, amber-400). Recommended fix: delete CBT's own alias layer entirely and redefine `tailwind.config.ts` colors using the exact Universal values, under the same semantic names Universal uses — primary (`#3b82f6`), error (`#ef4444`), success (`#22c55e`), warning (`#f59e0b`), plus the full neutral scale. Remove the redundant middle system rather than reconciling three layers.

2. Dead Token Removal

--dark-blue (`#1E3A8A`) is confirmed genuinely unused anywhere in the codebase (verified by direct search). Remove it from `tailwind.config.ts` during the same pass as item 1.

3. Component Extraction — 7 Confirmed Shared Patterns

Verified by a dedicated re-scan pass (superseding an earlier inaccurate count of 5). Build these first, on the new Universal-derived tokens directly — not on the old values with a color migration later.

Component	Occurs On
Primary Solid Button	Auth, Student Dashboard, Exam Console, Result Review (8+ instances)
Primary Gradient Button	Landing Page, Student Dashboard
Card Container	Student Dashboard, Result Review
Modal / Dialog Overlay	Auth, Student Dashboard, Exam Console
Dark Form Input Field	Auth, Student Dashboard
Status / Alert Box (translucent bg + tinted border)	Auth, Student Dashboard, Exam Console, Result Review
Outline Badge / Pill	Landing Page, Student Dashboard

4. Critical: Question-Rendering Logic Is Duplicated, Not Shared

Verified directly: Result Review does not import anything from Exam Console. Both files independently import `react-latex-next` and `katex`, both independently declare an identical `SUBJECT_LABELS` constant, and both independently implement question-stem and diagram rendering (including separate `dangerouslySetInnerHTML` calls for SVG diagrams). A future content or bug fix has to be made in two places and will silently drift if a developer only remembers one. Extract a single shared `QuestionCard` component and a single shared `SUBJECT_LABELS` constant, imported by both pages. This is a correctness fix, not a style preference — prioritize alongside component extraction, not as later cleanup.

5. Question Bank Page — Confirmed Scope

Confirmed: Question Bank Page is NOT a deliberately distinct admin style. It receives the same rebrand and the same 7 shared components as every other page — no exception.

6. Forward Pointer — AI-Flag Color

--color-accent-ai-flag (gold) is not used anywhere in CBT yet, but CBT already has a confirmed future AI feature — the cumulative performance review narration. When built, its AI-generated narration text should be the first real usage of this token anywhere in Aurikrex. Flagging now so it isn't improvised later under deadline pressure.

Page-by-Page Detail

Landing Page

STANDARD

/

Marketing page — features, pricing, subjects, funnel to register.

Fix Actions:

- Repoint bg-slate-950, text-slate-100/400, bg-indigo-600/text-indigo-400, border-slate-800 to new tokens
- Extract Primary Gradient Button and Outline Badge/Pill here first — both originate on this page
- Decide: keep a gradient treatment on the new primary blue, or drop to the flat fill used everywhere else. Recommend flat fill unless marketing wants a gradient reserved specifically for this page.

Missing States: N/A — static marketing page

Responsive: Well covered — sm/md/lg breakpoints throughout, explicit mobile menu toggle

Auth Page

STANDARD

/auth

Login, register, CBT key roaming access, verification, password reset.

Fix Actions:

- Repoint all raw Tailwind color usage (highest single-page count of bypasses in the audit)
- Extract Dark Form Input Field, Primary Solid Button, and Modal/Dialog Overlay
- Apply canonical Universal focus ring to every input (currently focus:border-indigo-500 only, no box-shadow ring)

Missing States: Loading and error/success implemented. Disabled NOT implemented — buttons don't disable during submission, allowing double-submit. Fix alongside rebrand as a functional bug, not just style.

Responsive: Minimal, acceptable for a centered single-column layout

Student Dashboard

CRITICAL

/dashboard

Progress, subject combinations, CBT key, launches mock exams/drills.

Fix Actions:

- Highest component-reuse page — uses all 7 shared components. Prioritize once components exist, since fixing this page validates all 7 at once.
- Repoint bg-slate-950, bg-indigo-600, text-slate-400 to new tokens

Missing States: Best state coverage of any CBT page: loading, empty, error, success, disabled all implemented

Responsive: Good — md:grid-cols-3, sm:flex-row used appropriately

Question Bank Page

CRITICAL

/questions

Admin/ops interface for searching, managing, and bulk-importing questions.

Fix Actions:

- CONFIRMED: full unification into the rebrand, no admin exception
- Most barebones page in the app — needs all 7 shared components applied, not just a color pass
- Already partially reads tailwind.config aliases (bg-background, text-text-primary, bg-primary) — repoint once the alias layer is redefined per Global Fix #1; this page is structurally closest to token-driven already
- Error box uses border-blue-200 bg-blue-50, unused elsewhere — resolve to the standard error/info pattern

Missing States: Success/error via plain text. Loading, empty, disabled NOT implemented — no spinners, buttons don't disable.

Responsive: Minimal — one md:grid-cols-2 breakpoint

Exam Console

CRITICAL

/exam/:sessionId

Timed exam-taking environment — the highest-stakes screen in the app.

Fix Actions:

- Repoint all raw Tailwind (bg-slate-950, text-indigo-500, bg-indigo-600, bg-rose-600) to new tokens
- Extract Primary Solid Button, Modal/Dialog Overlay, Status/Alert Box (timer warning state) here
- CRITICAL: question-rendering markup becomes the shared QuestionCard component per Global Fix #4 — do not restyle independently of that fix
- Timer, answer-option states, progress tabs, and index-grid sidebar are CBT-original with no Library precedent — remap colors to Universal tokens (primary for selected/active, warning for under-5-minutes timer, neutral scale for unanswered) but preserve the existing interaction logic, which is well-built

Missing States: Loading, error, disabled implemented. Empty/success N/A during an active exam.

Responsive: ■ HIGH STAKES — uses hardcoded JS breakpoint (window.innerWidth >= 768) separate from CSS breakpoints. Recommend replacing with a matching Tailwind breakpoint so the two can't drift apart.

Note: This page and Result Review should be tested on real low-end Android devices before launch, given the target user base and time-pressure context.

Result Review

CRITICAL

/results/:resultId

Post-exam score breakdown, timing stats, full correction map.

Fix Actions:

- Repoint bg-slate-950, text-indigo-400/border-indigo-500 (score card), emerald/rose (correct/incorrect) to new tokens — emerald/rose map directly to --color-success/--color-error
- Extract Card Container (shared with Student Dashboard)
- CRITICAL: replace the independently duplicated question-rendering markup and SUBJECT_LABELS constant with the shared QuestionCard component per Global Fix #4
- Correction-map status coloring is a genuinely good pattern — preserve the interaction design, just repoint raw emerald/rose/slate values to the new tokens

Missing States: Loading and error implemented. Empty/success/disabled not applicable.

Responsive: ■ HIGH STAKES — md:grid-cols-3 and sm:grid-cols-2 present, but explicitly verify the correction map stays legible on small mobile screens, since this is where a student reviews exactly what they got wrong.

Instruction to development team: Execute in the phase order given in the Priority Summary. Fix the token layer and build the 7 shared components before restyling individual pages. Consolidate the duplicated question-rendering logic (Global Fix #4) at the same time as component extraction, since it is a correctness risk independent of the visual rebrand.
